Next Generation 9-1-1 Modification Plan Narrative

The Des Plaines Valley ETSB (aka Hickory Hills Police Department ETSB) 9-1-1 System is transitioning from E9-1-1 to Next Generation 9-1-1 (NG911). AT&T is the 9-1-1 System Provider (“SSP”).

The Des Plaines Valley ETSB 9-1-1 System will comply with all Federal and State laws and with National Emergency Number Association Standards (NENA) that pertain to NG911, including the NENA i3 Standard for Next Generation – NENA-STA-010.3a-2021.

The State of Illinois has selected AT&T to provide a Statewide Next Generation 9-1-1. AT&T’s ESInet combines AT&T’s network capabilities with technology from Intrado Life & Safety, Inc. (Intrado). The AT&T ESInet solution will facilitate an efficient transition from legacy 9-1-1 networks to networks capable of supporting the growing demands of more mobile society. With AT&T ESInet, the State is taking advantage of AT&T’s investment in a pre-built, cloud-based solution that delivers next-generation functionality. AT&T is also providing their industry leading AT&T VPN MPLS network for primary access to all PSAPs.

AT&T’s ESInet solution is a combination of their IP network and Next Gen Core Services (NGCS) components that includes industry leading SLAs, management services and tools to help ensure that they provide the best possible service.

The design is based on building redundant systems to avoid any single point of failure (SPOF) in the ESInet and the overall NG911 Network Architecture. The NG 911 system will provide flexibility in the routing of calls. The ESInet being deployed has all PSAPs connected and can route calls based on not only location, but also by availability. In a Next Generation solution, a call will be answered through intelligent routing. Additionally, there will be more available positions to answer calls because all connected and tested PSAPs will be technically able to answer the call and will be able to dispatch or transfer the call to another PSAP.

AT&T’s ESInet defense-in-depth security is built into the architecture. AT&T’s Global IP Network is monitored by 8 different Security Operations Center (SOC) facilities located across the world. AT&T uses its security portfolio capabilities to protect their data centers and networks.

AT&T’s ESInet provides six (6) geographically diverse and fully redundant facilities to increase resiliency and survivability in natural and man-made disaster scenarios, with scalable capacity capable of supporting more than twice the 9-1-1 busy hour calls for the entire United States. AT&T has documented business continuity and restoration plans, including complex disaster and evacuation contingencies. The 24x7 operations center employs an Incident Handling process modeled on FEMA’s Incident Command System, with notifications built into the process.

The ESInet is monitored 24x7x365 from a Network Operations Center (NOC) with tier 2 and tier 3 technical resources dedicated to the AT&T ESInet. AT&T's 9-1-1 Resolution Center has dedicated public safety resources.

The AT&T ESInet provides a flexible routing platform that supports both ESN (tubular) and GIS (spatial) routing on the same Emergency Call Routing Function (ECRF).

The ESInet solution will interconnect to legacy selective routers as defined per NENA standards. ST&T provides redundant, public safety grade points of presence in each LATA for OSP ingress locations for Legacy Network Gateways (LNGs).

AT&T will interconnect to legacy selective routers to transfer and/or receive calls with Automatic Number Identification (ANI) and Automatic Location Identification (ALI) information to the State's NGCS via legacy means through the Legacy Selective Router Gateway (LSRG). Interconnections will also allow legacy PSAPs served by legacy selective routers to serve as the abandonment route for PSAPs served by legacy selective routers to serve as the abandonment route for PSAPs served by the AT&T ESInet solution.

Connectivity extends beyond the internal ESInet transport to external network and OSP interfaces. The ESInet supports both TDM and IP OSP ingress at geographically distributed Points of Interconnection (POIs). The ESInet supports standards-based protocol interfaces to external ESInets for call hand-off and call transfers. With pre-established connectivity capabilities, PSAPs on the ESInet have the ability to transfer calls to PSAPs on other ESInets or PSAPs that have not yet transitioned off legacy selective routers.

AT&T will coordinate getting the OSPs records into the AT&T ESInet database. AT&T will also jointly plan the interconnecting network with the OSP. Circuits will be ordered and implemented between the OSP and the ESInet POI. The ESInet POI may reside in an AT&T office or hub. AT&T will cooperatively test and turn up all trunking arrangements with the OSP. Traffic migrations from the legacy to new AT&T infrastructure will follow.

Integrated Text-to-911 is supported by the ESInet.

AT&T is responsible for negotiating interconnection agreements and trunking arrangements with each service provider. Interconnection agreements will include the roles and responsibilities of the Parties related to the exchange of 9-1-1 traffic including but not limited to, split rate centers, tandem to tandem and IP connections.

GIS data is submitted to the AT&T ESInet via a web-based spatial interface (SI) portal. The portal provides secure GIS file transfer. 9-1-1 Authorities can maintain their local database schema and configure database changes using attributed field mapping tools.

The Spatial Interface (SI) validation engine logs errors back to the originating 9-1-1 Authority in comprehensive reports that are retrieved in the 9-1-1 Enterprise Geospatial Database Management System (9-1-1 EGDMS). Validation errors are corrected by the 9-1-1 Authority within their own GIS database. Updates are submitted and processed on an on-going basis.

AT&T's ESInet cyber security policies, standards, and guidelines are consistent with industry best practices as defined by International Organization for Standardization and Control Objectives for Information and related Technology. The AT&T ESInet is a highly secure, privately managed IP network providing IP based call routing services for NG911 call delivery. All inbound and outbound traffic interactions are with pre-authorized entities, utilize agreed upon protocols and transverse controlled access points. Call processing and real-time data delivery are protected through both physical and logical controls.

Sensitive data resides in trusted data centers that employ logical and physical access controls. All hardware and software elements deployed in production environment go through stringent release management processes that incorporate thorough penetration scan testing. Corporate and development environments are separate from production and are not used in development or system test environments. Inter-zone traffic is restricted to only that of authorized personnel and the necessary protocols destinations used to support the management and the applications of the ESInet with all other traffic implicitly denied by way of redundant and diverse Session Border Controllers (SBC) and stateful firewalls.

A Network Operations Center (NOC) staffed 24 hours and day, seven days a week, 365 days a year to actively monitor and manage the AT&T ESInet end-to-end service is provided. When a potential or actual customer-affecting issue is detected, the Incident Administration team is engaged by the NOC. The team uses established processes that are ISO 9001:2008-compliant for immediate escalation, notification, resolution, and reporting. All building, NOC and Data Center access are monitored by 24x7 security and access control systems.

TEXT-to-911

Since integrated Text-to-911 is supported by AT&T ESInet, the Des Plaines Valley ETSB anticipates utilizing ModUcom software to facilitate the Text-to-911 communications received via the AT&T ESInet. Upon anticipated successful testing with upcoming AT&T ESInet deployment at the Des Plaines Valley ETSB utilizing AT&T ESInet and ModUcom, all agencies dispatched by the Des Plaines Valley ETSB will post announcements at their public meetings and on their websites the availability of the Text-to-911, an explanation of the use and shortcomings of the use for all the public to see. All member agencies will be provided with documentation to post in their respective building for the public to view.

BACKUP PSAP

The backup routing for the Des Plaines Valley ETSB 911 System will remain as is at this time.

The Des Plaines Valley ETSB 911 System receives calls through the Elk Grove selective router. The backup answering point for the calls from this router in the event of a failure or overflow are currently answered by Southwest Central 9-1-1 System in conjunction with a current agreement. Southwest Central 9-1-1 System will remain the backup answering point for processing 911 calls in the event of the inability of the Des Plaines Valley ETSB 911 System to answer and process 911 calls in accordance with the existing agreement.

The Des Plaines Valley ETSB 911 System Call Handing Agreements inclusive of call transferring remain the same.
